**Lab Task 01**

Q. Suppose a character is given like this. Take this as a string.

**char \*ch = "1232333.3422324234"**

- a. Write a code to find the length of the string without any built-in function.
- b. Write a code to find at what index is '.' (decimal) found.

Note:

1. You should only use pointers. if I see [] somewhere your quiz will be marked zero straight away.
2. You can not use string's built-in function.
